AMENDMENTS TO THE CLAIMS

1. (Currently amended) A method for manufacturing wood elements for musical instruments, comprising:

a laminating step in which a resin is coated onto or is impregnated into a plurality of <u>dyed</u> wooden plate units, fiber directions of the <u>dyed</u> wooden plate units are uniformly aligned, and the <u>dyed</u> wooden plate units are stacked and are subjected to thermal pressing so as to be bonded together and produce a laminated body <u>bodies</u>,

wherein the thermal pressing is being conducted by controlling a pressure so that a density of the laminated body bodies is in a range from 0.8 to 1.4 g/cm³ and a thickness of the laminated bodies is less than 20mm; and

a bonding step in which at least two of the laminated bodies are bonded together to produce the wood element having a thickness of 20 mm or more.

- 2. (Currently amended) The method for manufacturing wood elements for musical instruments according to claim 1, wherein a portion of the <u>dyed</u> wooden plate units is replaced with paper.
- 3. (Original) Wood elements for musical instruments obtained using the method for manufacturing wood elements for musical instruments according to claim 1.
- 4. (Original) A musical instrument that uses the wood elements for musical instruments according to claim 3.

5. (Currently amended) A method for manufacturing wood elements for musical instruments, comprising:

a first laminating step in which a resin is coated onto or is impregnated into a plurality of <u>dyed</u> wooden plate units, fiber directions of the <u>dyed</u> wooden plate units are uniformly aligned, and the <u>dyed</u> wooden plate units are stacked and are subjected to thermal pressing so as to be bonded together and produce a <u>first</u> laminated body; and

a second laminating step in which the <u>first</u> laminated body thus obtained is sliced along the fiber direction to produce laminated plate units, a resin is coated onto or is impregnated into the laminated plate units thus obtained, fiber directions of the laminated plate units are uniformly aligned, and the laminated plate units are stacked and are subjected to thermal pressing so as to be bonded together and produce a second laminated <u>body</u> <u>bodies</u>,

the thermal pressing in the second laminating step is being conducted by controlling a pressure so that a density of the second laminated bodies is in a range from 0.8 to 1.4 g/cm³[.] and a thickness of the second laminated bodies is less than 20mm; and

<u>a bonding step in which at least two of the second laminated bodies are</u> <u>bonded together to produce the wood element having a thickness of 20mm or more.</u>

6. ((Currently amended) The method for manufacturing wood elements for musical instruments according to claim 5, wherein the thermal pressing in the first laminating step is conducted by controlling a pressure so that a density of the <u>first</u> laminated body is in a range from 0.4 to 0.6 g/cm³, in the first laminating step.

7. (Currently amended) The method for manufacturing wood elements for musical instruments according to claim 5, wherein a portion of the <u>dyed</u> wooden plate units is replaced with paper.

- 8. (Original) Wood elements for musical instruments obtained using the method for manufacturing wood elements for musical instruments according to claim 5.
- 9. (Original) A musical instrument that uses the wood elements for musical instruments according to claim 8.
- 10. (Currently amended) Wood elements for musical instruments, comprising at least two laminated wooden plate units, bodies bonded together to have a thickness of 20mm or more, each of the laminated bodies having including laminated, dyed wooden plate units whose fiber directions are uniformly aligned fiber directions, and having a thickness of 20 mm or less, and a density of 0.8 to 1.4 g/cm³.
- 11. (Original) A musical instrument that uses the wood elements for musical instruments according to claim 10.
- 12. (Currently amended) A method for manufacturing wood elements for musical instruments, comprising:

providing a plurality of wooden plate units;

dyeing the plurality of wooden plate units to produce a plurality of dyed wooden plate units;

applying a resin to the plurality of dyed wooden plate units;

stacking the <u>dyed</u> wooden plate units with fiber directions of the wooden plate units aligned; and

thermal pressing the <u>dyed</u> wooden plates units to create a laminated body, <u>bodies</u>, wherein the thermal pressing is controlled to produce the laminated body <u>bodies</u> with a density in a range from 0.8 to 1.4 g/cm³ [.] <u>and a thickness less than</u> <u>20mm; and</u>

bonding at least two of the laminated bodies together to produce the wood element having a thickness of 20 mm or more.

13. (Previously presented) The method for manufacturing wood elements for musical instruments according to claim 12, wherein the thermal pressing comprises applying a pressure between 65 and 300 kg/cm².
